

Equipment Workspace

The Equipment Workspace is used to build and configure individual pieces of equipment, manage equipment rack elevations and full lineups, or create new equipment masters. Masters can be copied (cut and paste) in any structure, landmark etc. relieving the need to duplicate efforts. Once copied, the equipment can be modified if/when needed. FiberBase® comes packaged with over 400 master templates for equipment and cables from various manufacturers ready to use. You can view the front or the back of any equipment with a simple click of a toolbar button – allowing for a quick view of the status of ports, cards etc. (ie. built out, connected, bad). Balloon help allows for quick viewing of equipment attributes. The F2 “hot key” or, the right click “send to” feature allows for viewing of detailed equipment attributes.
