

Explorer Workspace

The Explorer Workspace organizes the network data hierarchically in a familiar “Windows™ Explorer” style for ease of use and clear visualization. The user can drill down to all network elements (e.g. Regional facilities, installed equipment, connected fibers or copper cables, associated sheath routes, etc.). The explorer also gives the user a view of all information associated with any network asset in the tabs adjacent to the folder pane. Any network asset can be selected from the explorer view and sent to any other FiberBase® workspace with a simple right click of the mouse. The Tabs shown are a sample of numerous tabs available. Tabs can be added or deleted per the customers and/or users need/preference ([See Workspace Customization](#)).
